 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Nishimura M., Matsuo H., Sugiyama M.;
"Blasticidin S-producing Streptcmyces morookaensis possesses an enzyme activity with hydrolyzes puromycin.";
FEMS Microbiol. Lett. 132:95-100(1995).
-I- FUNCTION: INACTIVATES PUROMYCIN BY CATALYZING THE HYDROLYSIS OF THE AMIDE LINKAGE BETWEEN ITS AMINONUCLEOSIDE AND O-METHYL-L-TYROSINE MOIETIES. THE OPTIMUM PH IS 8.0 AND THE OPTIMAL TEMPERATURE IS 45 DEGREES CELSIUS.
 -!- FUNCTION: MAY HAVE AMINOPEPTIDASE ACTIVITY.
-!- ENZYME REGULATION: STIMULATED BY DTT. STRONGLY INHIBITED BY ZINC
ION, FERROUS ION, CUPRIC ION, MERCHRY ION, N-BROMOSUCCINIMIDE AND
N-ETHYLMALEIMIDE. PARTIALLY INHIBITED BY COBALT ION.
 Nishimura M., Matsuo H., Nakamura A., Sugiyama M.; Matsuo A. "Purification and characterization of a puromycin-hydrolyzing enzyme from blasticidin S-producing Streptomyces morookaensis."; J. Biochem. 123:247-252(1998).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGP) factor betal (TGP-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGP-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis Hepatotropic, antagonist, transforming growth factor betal, TGF-bl, competitive inhibition, collagen synthesis stimulation inhibitor, liver, extracellular matrix degradation inhibitor, mimetope, cirrhosis. Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.  The invention relates to diagnosing, determining the stage or severity, or indentifying the risk of a subject developing cancer (especially breast cancer), or monitoring the effect of therapy on a subject with cancer, comprising analysing the effect of therapy on a subject with cancer, and detecting Breast Cancer-Associated Protein Isoforms (BPIs). The and detecting Breast Cancer, and for the disclosed are used for the diagnosis and prognosis of breast cancer, for determining the severity of breast cancer, and monitoring cancer, for determining the severity of breast cancer, and monitoring the effect of therapy administered to a subject. Antibodies raised against the binding domain of a BPI, the binding domain of a BPI, the binding domain of a BPI, the binding domain of a BPI, the cancer inhibits the function cancer are an uncleic acid encoding a BPI, or a nucleic acid that inhibits the function cancer in a BPI can be incorporated into a pharmaceutical composition for treating or preventing breast cancer. The methods use sensitive and specific biomarkers provide early diagnosis of breast cancer, and the fewer side effects that other prior art methods use amore rapid effect with fewer side effects that other prior art methods. The present sequence is a tryptic digest peptide from a BPI of the invention

The present invention describes a method for screening or diagnosing ErbB2-related cancer. The method comprises generating ErbB2 overexpression features (EOFs) from test samples of body fluid from the subject by electrophoresis, and comparing the EOFs in the test sample capture (ERF) in the test sample. Also described: (1) an antibody capable of immunospecific binding to an ErbB2 overexpression protein isoform (EOPI); (2) pharmaceutical compositions comprising an EOPI, a nucleic acid encoding an EOPI, an amount of the above antibodies and/or EOPIs cited of carrier; (3) a kit comprising one or more antibodies and/or EOPIs cited above, other reagents and instructions for use; (4) methods of treating or preventing ErbB2-related cancer; (5) methods of screening for or greventing ErbB2-related cancer; (6) methods of screening for or comprising one or more EOPIs, EOPI fragment, EOPI-related polypeptides, or EOPI-fusion proteins; (6) a method for modulating the activity of one or more EOPIs, comprising administering to a subject an expression or activity and can be used in vaccines and gene therapy. The cyclostatic activity and can be used in vaccines and gene therapy. The method is useful in screening, diagnosing, preventing or treating ErbB2-related cancer, determining the stage or severity of ErbB2-related cancer, determining the stage or severity of ErbB2-related cancer, determining the stage or severity of ErbB2-related cancer, identifying a subject at risk of developing ErbB2-related cancer, mentoring the effect of therapy administered to a subject with ErbB2-related cancer.

neutrophil inhibitory factor; NIF; glycoprotein; endoparasite; nematode; parasitic worm; canine hookworm; peritoneal inflammation.
 Neutrophil Inhibitory Factor was isolated from canine hookworms. The NIF was digested with either endoproteinase AspN, LysC or trypsin and the resulting proteolytic fragments were sequenced. See AAR42489- AAR42493 for the trypsin fragments. (Updated on 25-MAR-2003 to correct PN field.)

 The invention relates to a method of screening or diagnosing Alzheimer's disease in a subject. The method is useful for screening, diagnosis or prognosis of Alzheimer's disease in a subject for determining the stage of severity of Alzheimer's disease in a subject of determining the stage subject at risk of developing Alzheimer's disease, or for monitoring the effect of therapy administered to a subject having Alzheimer's disease. The method is also useful in treating vascular dementia, Lewy body dementia, schizophrenia, Parkinson's disease, multiple sclerosis or depression. The inventive method identifies sensitive and specific biomarkers for the diagnosis of Alzheimer's disease in living subjects. It provides therapeutic agents for Alzheimer's disease that works quickly, potently, specifically with fewer side effects. The present sequence represents the amino acid sequence of a Alzheimer's diseaser.
related cancer, and for drug screening or drug development. The kit is useful in carrying out the above methods. ABP98940 to ABP99206 represent specifically claimed EOPIs from the present invention

The specification describes mutant Neutrophil Inhibitory Factors (NIFs), where at least 1 of the Asp residues at positions 18, 87, 110, 130, 197, or 223 in the wild type sequence (see AAY23591) is replaced by a Gln residue. NIFs may be useful for treating shock, stroke, acute and chronic allograft rejection, vasculitis, autoimmune diabetes, rheumatoid arthritis, inflammatory skin diseases, inflammatory bowel disease, adult respiratory distress syndrome (ARDS), ischemia-reperfusion injury collowing myocardial infarction, and acute inflammation caused by bacterial infection such as sepsis or bacterial meningitis. NIFs or NIF cargments may be useful for detecting infection of a mammalian host by a parasitic worm, as antihelminic agents, and in the detection and isolation of NIF from tissue homogenates, cloned cells etc. NIFs may be useful for the detection of a mammalian host by a parasitic worm, as antihelminic agents, and in the detection and useful for the detection of NIF mimics or suseful for the detection of NIF mimics of a canine hookworm NIF, agents, AAY23572-90 represent peppide fragments of a canine hookworm NIF,
 Antigenic determinant peptide(s) of HTLV envelope glyco:protein - useful for detecting anti-HTLV-I and -II antibodies and as vaccine against HTLV.

 Neutrophil inhibitory factor peptide(s) - derived from nematodes, useful for therapy of inflammatory responses.
 Neutrophil inhibitory factors can be used in compositions to inhibit neutrophil activity e.g. adhesion to vascular endothelial cells, and which are useful in the therapy of conditions which involve abnormal or undesired inflammatory responses. This is a peptide fragment of a neutrophil inhibitory factor from canine hookworm which was designated 124 and obtained by trypsin digestion of the factor. (Updated on 25-MAR-2003 to correct PN field.)

 The invention relates to new synthetic hydrophilic peptides (AAY17922-934) that correspond to at least one of antigen determinants of envelope sugar proteins of HTLV-I identified in the B lymphatic corpuscle. When bonded covalently to a carrier molecule, the peptides can induce the production of an antibody having a high titre to the gp46 and sp53 envelope sugar proteins of HTLV-I and HTLV-II in mammals. The carrier molecule is preferably a tetanus toxoid and selected from the group of sequences shown in AAX17935-39. The carrier molecule is preferably bonded to the peptide through at least one spacer molecule (preferably a dipeptide glycine-glycine). The peptides form effectively immunological response to factors causing virus HTLV-II and HTLV-II. The method also provides an effective conjugate having the peptide
 Hydrophilic peptide; antigen determinant; envelope sugar protein; HTLV-1;
HTLV-II; B lymphatic corpuscle; gp46; gp63; tetanus toxoid.
 The sequence of peptide 4 corresponds to residues 129-149 from the HTLV-I
 gp46 external envelope glycoprotein. When covalently linked to a carrier mon. the hydrophilic peptide can induce in a mammal the prodn. of high titres of antibodies to gp46 envelope glycoprotein from HTLV-I or -II. The peptide and carrier may be used in vaccines against HTLV-I or -II infection. The peptide may be used in a diagnostic assay to detect the presence and titre of anti-HTLV antibodies. See also AAR34225-57. (Updated on 25-MAR-2003 to correct PN field.)
 -y...ustic nyarophilic peptide - comprises 25 unit aminoacid that corresponds to at least one antigen determinant of envelope sugar protein(s) of HTLV-I and HTLV-II.

 phosphopeptide, protein tyrosine phosphatase, cancer, diabetes, obesity, inflammation, multiple sclerosis, angiogenesis-dependent disease,
 The present invention relates to phosphopeptides that inhibit protein tyrosine phosphatase. The phosphopeptides are useful as a medicament or for manufacturing a medicament for the treatment and/or prevention of cancer (i.e. stomach or intestina cancer), diabetes and/or obsity, inflammation, multiple sclerosis, angiogenesis-dependent disease (e.g. solid cancer or metastatic cancer) or infectious disease (i.e. leishmaniasis), or as a suppressor of appetite. These may also be used for preventing or treating congestive heart failure, neurodegenerative diseases, ischaemic events of the brain or demyalinating diseases. The present sequence is one such phosphopeptide from protein tyrosine
 New phosphopeptides that inhibit protein tyrosine phosphatases, useful for manufacturing a medicament for preventing or treating e.g. cancer, diabetes, obesity, inflammation, multiple sclerosis or infectious

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
 November 14, 2004, 13:46:55; Search time 188 Seconds (without alignments) 27.545 Million cell updates/sec

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Borras Cuesta F;

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors. WPI; 2000-411935/35.

Disclosure; Page 31; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y9313 represent examples of the peptides of the invention. The peptides act by competitive inhibitors of stimulation of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or disease, specifically cirrhosis

```
This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
 New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.

 The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAV92945-Y9313 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or
 Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
 Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

 The invention relates to a novel human CDR-grafted antibody, or its fragment. The antibody or fragment reacts specifically with the extracellular region of human CC chemokine receptor 4 (CCR4) but shows no reactivity toward human platelets. The antibody of the invention has cytostatic, antiallergic, antiinflammatory and immunomodulator activity. The antibodies and their fragments are applicable in the diagnosis and treatment of e.g. cancer and immune diseases. The present sequence is used in the exemplification of the invention

particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable response to whole antigens is directed largely toward variable response to whole antigen, and myoup-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants: Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups, (TL and HTL), and further, to modify the composition of the groups, and further, to modify the composition of the groups, and further, the modulated, as immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
 ó
 The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine

compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Purthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (cTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPIISO1 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)

militure billioned peptides (including immunodominant peptides)

proteins or defined peptides (including immunodominant peptides)

artigenic peptides or conserved motifs). Also included are a process for detecting a virus associated with multiple sclerosis or rheumatoid arthritis, a process for a virus associated with multiple sclerosis or rheumatoid arthritis, a prime sasociated with multiple sclerosis or rheumatoid arthritis, a prime for the amplification by polymerisation of a nucleic acid of a virus material associated with multiple sclerosis or rheumatoid arthritis, a polypeptide exhibiting an inhibitory activity on the proteolytic, reverse transcriptase or ribonuclease H activity from MSRV, and an antibody directed against the MSRV-1 virus obtained by immunogenic agent consisting a human or animal body or cells with an immunogenic acids are useful for detecting a biological sample a virus associated with multiple sclerosis or rheumatoid arthritis, or for detecting in a biological sample, the presence of or exposure to a virus associated with multiple sclerosis or rheumatoid arthritis. The present sequence is an MSRV immunogenic or antigenic peptide (or a conserved peptide motif). Note: The SEQ ID numbers for the sequences as displayed in the main body of the patent do not match the SEQ ID numbers in the sequence listing.

## ALIGNMENTS

Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis. Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors. Ezquerro Saenz IJ, Lasarte Sagastibelza JJ, Prieto Valtuena J; Transforming growth factor inhibitory peptide P142. (CIEN-) INST CIENTIFICO & TECNOLOGICO NAVARRA. AAY93096 standard; peptide; 9 AA 98ES-00002465. 99WO-ES000375. (first entry) WPI; 2000-411935/35. Borras Cuesta F; WO200031135-A1. Homo sapiens. 23-NOV-1999; 24-NOV-1998; 08-NOV-2000 02-JUN-2000. The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
The present invention describes a number of peptides which are able to bind to HIV glycoprotein 120 (gp120). These are similar to the human chemoxine receptors CCRS. CXCR4 and STR133, as well as CD4. The invention relates to a novel stable pharmaceutical composition comprising one or more interferon (IFN) beta compound(s) formulated for mucosal delivery to a mammalian subject in combination with one or more mucosal delivery to a mammalian subject to the composition following mucosal administration to the subject yields enhanced mucosal delivery of the one or more IFN-beta compound(s). A composition following composition to the subject yields enhanced mucosal delivery of the one or more IFN-beta compound(s). A composition is useful for treating autoimmune diseases, viral disease, for alleviating one or more comminate, papilloma virus warts of the larynx or skin or childhood viral encephalitis in the subject without unacceptable adverse side effects. The composition can be delivered intransally which reduces or eliminates compliance problems and side effects that attend delivery by injection. The sequences shown in AbG94022-Ap034810 represent permeabilising

 Composition comprising biologically active agent and permeabilizing peptide that reversibly enhances mucosal epithelial paracellular transport by modulating epithelial junctional structure and/or physiology in mammal.
 This invention relates to a novel composition comprising a biologically active agent and mucosal delivery-enhancing effective amount of permeabilising peptide that reversibly enhances mucosal epithelial paracellular transport by modulating epithelial junctional structure and/or physiology in a mammal. The agent of the invention inhibits homotypic binding of epithelial membrane adhesive protein chosen junctional adhesion molecule (JAM), occludin and claudin. The biologically active agent is effective for treatment of sexual dysfunction, for example male erectile sexual dysfunction or female execual dysfunction. The present sequence is that of a permeabilising peptide of human JAM-2 which may be used during the production of the composition of the invention.

 The invention describes an intranasal composition comprising peptide YY compound(s) formulated for mucosal delivery to a mammalian subject. Also described is a kit for treatment of a mammalian subject comprising the intranasal composition of peptide compound(s). The composition is used for treating obseity, cancer, or malnutrition or wasting related to cancer in the subject. It is used to alleviate Alzheimer's disease, colon adenocarcinoma, pancreatic adenocarcinoma, breast carcinoma, treatment and prevention of malnutrition resulting from istrogenic causes or cachexia associated with advanced disease, or cancer cachexia in the subject. The composition alleviates the symptoms without unacceptable adverse side effects. This is the amino acid sequence of a human junctional adhlesion molecule 2 (JAM-2) that may be used in a composition of the invention to modulate epithelial junction structure and/or
Intranasal compositions for treating obesity, cancer, or malnutrition or wasting related to cancer, comprises peptide compound(s) formulated for mucosal delivery to mammalian subject.

CATALYTIC ACTIVITY: S-adenosyl-L_methionine = (5-deoxy-5-adenosyl) (3-aminopropyl) methylsulfonium salt + CO(2).

1- COFACTOR: Pyruvoyl group.

1- PATHWAY: Decarboxylation of S-adenosylmethionine provides the aminopropyl moiety required for spermidine and spermine biosynthesis from putrescine.

1- SUBDINIT: Heterotetramer of two alpha and two beta chains.

1- DEVELOPMENTAL STAGE: Expressed only during exponential growth.

1- INDUCTION: Stimulated by putrescine. Inhibited by aromatic diamidines berenil, pentamidine, propamidine, hydroxystilbamidine, by ethidium bromide and methylglyoxal. AdoMetDC family.

PIR: S18763; S18763.
 -i- FUNCTION: S-adenosylmethionine decarboxylase is essential for the biosynthesis of spermine and spermidine. The alpha subunit contains the active site.

Nishimura M., Matsuo H., Sugiyama M.;
"Blasticidin S-producing Streptomyces morookaensis possesses an enzyme activity with hydrolyzes puromycin.";
PEMS Microbiol. Lett. 132:95-100(1995).
-!- FUNCTION: INACTIVATES PUROMYCIN BY CATALYZING THE HYDROLYSIS OF THE AMIDE LINKAGE BETWEEN 1TS AMINONUCLEOSIDE AND O-METHYL-L-TYROSINE MOLETIES. THE OPTIMUM PH IS 8.0 AND THE OPTIMAL TEMPERATURE IS 45 DEGREES CELSIUS.
 FUNCTION: MAY HAVE AMINOPEPTIDASE ACTIVITY.
BY REGULATION: STIMULATED BY DIT. STRONGLY INHIBITED BY ZINC
ION, FERROUS ION, CUBRIC ION, WERCURY ION, N-BROWCSUCCINIMIDE AND
N-ETHYLMALEIMIDE. PARTIALLY INHIBITED BY COBALT ION.
 Nishimura M., Matsuo H., Nakamura A., Sugiyama M.;
"Purification and characterization of a puromycin-hydrolyzing enzyme
from blasticidin S-producing Streptomyces morookaensis.";

Claim 5; Page 81; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

 The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y9313 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver
 Hepatotropic; antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
 Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial

 A novel human breast susceptible gene coded protein 10.45 polypeptide, and the polynucleotide encoding it, useful for treating several diseases e.g. embryotic development deformity and tumors.
 The present invention describes human breast susceptible gene coded protein 10.45 (I). Also described is a process for preparing (I) using DNA recombination techniques. (I) can be used for treating several diseases e.g. embryotic development deformity and tumours. The present sequence represents the N-terminal peptide of (I), which is used in an example from the present invention

response in a subject, determining the stage or severity of a liver response in a subject, dentifying a subject at risk of developing liver response, or monitoring the effect of therapy administered to a subject having liver response. The method involves detecting liver Response. Associated protein Isoforms (LRPIS) in a test biological sample from the subject, which has an activity or level indicative of a liver response. LRPIS are selected from any one of the compounds given in the specification e.g. LRPI-1.1, LRPI-2.1, LRPI-3.1 and LRPI-4.1 a subject, or monitoring the effect of a drug or therapy administered to a subject, or monitoring the effect of a drug or therapy administered to a subject, or more consecutive nucleotides complementary to a nucleotide sequence encoding an LPRI with RNA obtained from a biological sample from the nucleotides complementary to a nucleotide sequence conditions that permit hybridisation of the probe to the nucleotide sequence. The more conditions that permit hybridisation if any, between the probe and the nucleotide sequence, and comparing the hybridisation, if any, detected in the above step, with the hybridisation detected in a control sample, or with a previously determined reference range. The method is cueful for screening or diagnosing a liver response in a subject, determining the stage or severity of a liver response, and control determining the stage or severity of a liver response, and monitoring the effect of therapy administered to a subject, determining the public or all liver response in a subject, determined the reference and the response in a subject, determined the reference of the response of a liver response of a liver response.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Ezquerro Saenz IJ, Lasarte Sagastibelza JJ, Prieto Valtuena J; Borras Cuesta F;

WPI; 2000-411935/35.

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Claim 5; Page 81; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

 The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis
those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver

This invention relates to a novel method for producing a humanised antibody variable (V) domain or its fragment by optimising sequence similarity between individual antibody framework regions (FRS) in order to identify suitable human FRS (hursh). Specifically, it refers to novel immune system molecules i.e. humanised monoclonal antibodies that exhibit suitable binding affilinty with reduced immunogenicity in humans. The present invention describes a method of mutagenising DNA of non-human FRS to encode humanised FRS having an amino acid sequence that is ubstantially identical to the selected human. FR previously identified through sequence similarity searching. As such, this method provides humanised light or heavy chain v domains of the sequence huRRI-CDRI-huFR2 CDR2-huFR3-CDR3-huFR4, which can be used as therapeutic or diagnostic products to treat and, or diagnose diseases in humans and animals. Furthermore, the method expands the number of best fit possibilities that can be generated and provides a rational basis for assembling nearly all humanised immune system molecules of interest. This peptide sequence represents a hypervariable region (CDR) of the muxine anti-LTA (A110) heavy chain antibody protein of the invention.
 ö
 Producing humanized antibodies for diagnostic and therapeutic purposes comprises optimizing similarity between individual antibody framework regions to help identify human framework regions suitable for making the
of gram positive bacterial infections. Sequences AAW94735-39 represent heavy chain variable regions of the anti-lipoteichoic antibody 96-100

 The present invention describes a method (M1) for screening or diagnosing a liver response in a subject, determining the stage or severity of a liver response in a subject, identifying a subject at risk of developing liver response, or monitoring the effect of therapy administered to subject having liver response, involving detecting liver response. Subject having liver response to ARR75806 in a test biological sample from the subject. Alternatively, screening or diagnosing a liver response in a subject, or monitoring the
 A novel human breast susceptible gene coded protein 10.45 polypeptide, and the polynucleotide encoding it, useful for treating several diseases e.g. embryotic development deformity and tumors.
 The present invention describes human breast susceptible gene coded protein 10.45 (I). Also described is a process for preparing (I) using DNA recombination techniques. (I) can be used for treating several diseases e.g. embryotic development deformity and tumours. The present sequence represents the N-terminal peptide of (I), which is used in an example from the present invention

subject, which has an activity or level indicative of a liver response.

LRPIs are selected from any one of the compounds given in the specification e.g. LRPI-1.1, LRPI-2.1 and LRPI-4.1.

Alternatively, screening or diagnosing a.liver response in a subject, or monitoring the effect of a drug or therapy administered to a subject, or monitoring the effect of a drug or therapy administered to a subject, involves contacting at least one oligonucleotide probe comprising 10 or more consecutive nucleotides complementary to a nucleotide sequence encoding an LPRI with RNA obtained from a biological sample from the subject or with cDNA copied from the RNA, where the contacting occurs under conditions that permit hybridisation of the probe to the nucleotide sequence, and comparing the hybridisation, if any, detected in the above step, with the hybridisation detected in a control sample, or with a previously determined reference range. The method is useful for screening or diagnosing a liver response in a subject, determining the stage or severity of a liver response in a subject, determining the effect of therapy administered to a subject having liver response. This is the amino acid sequence of a liver response-associated feature (LRF) comprising one or more LRFI.

Mishimura M., Mateuo H.;

Mishimura M., Mateuo H.;

Mishimura M., Mateuo H.;

Supraction Stroptomyces morookaensis possesses an enzyme activity with hydrolyzes puromycin.

EEGIVITY With hydrolyzes puromycin.

The Aminopeptidase;

-I- FUNCTION: INACTIVATES PUROMYCIN BY CATALYZING THE HYDROLYSIS OF THE AMIDE LINKAGE BETWEEN ITS AMINONUCLEOSIDE AND O-METHYL-L-TRAOSINE MOIETIES. THE OFFICENTY PARTONUCLEOSIDE AND O-METHYL-L-TRAOSINE MOIETIES. THE OFFICENTY PROBLED BY ZINC TRAMBEATURE IS 45 DEGREES CELSIUS.

-I- FUNCTION: MAY HAVE AMINOPEPTIDASE ACTIVITY.

-I- ENZYME REGULATION: STIMULATED BY DIT. STRONGLY INHIBITED BY ZINC ION, FERROUS ION, CUPRIC ION, MERCHY ION, N-BROMOSUCCINIMIDE AND N-ETHYLMALEIMIDE. PARTIALLY INHIBITED BY COBALT ION.

-I- SUBGULTT: MONOWER.

-I- MISCELLANEOUS; HAS AN ISOELECTRIC POINT OF 6.4.

GO; GO:0016787; F: hydrolase activity; IEA.

MAMINOPEPTIGASE; Hydrolase.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimecopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
 Hepatotropic, antagonist, transforming growth factor betal, TGF-bl, competitive inhibition, collagen synthesis stimulation inhibitor, liver, extracellular matrix degradation inhibitor, mimetope, cirrhosis.
 Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
 Transforming growth factor inhibitory peptide #3

 The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGP) factor betal (TGP-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGP-bl and/or its receptors. Peptides AAY922945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
 Peptides AAW45983-W456025 are based on portions of somatostatin, somatostatin receptors (SSTR) and insulin-like growth factor binding proteins (IGFBP). They are capable of increasing weight gain, birth weight, growth rates, milk production, levels of circularing insulin, IGF-I and IGF-III, fibre production and muscle weight. They may be used to modulate carbohydrate metabolism and in treatment of diabetes. The oil carrier may be used for delivery of the peptides
useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
 New non-naturally occurring peptide(s) - which are based on portions of somatostatin, somatostatin receptors and insulin-like growth factor binding protein.
 Gaps
 Hormone, receptor, antibody, vaccine, immunogen, somatostatin, IGF, insulin-like growth factor binding protein, ILGFBP, SSTR, diabetes; somatostatin receptor, insulin-like growth factor.

peptides AAR86024-R86236 are examples of peptides and their mimetics that bind to endothelial leukocyte adhesion molecule (ELAM)-1. This molecule is a member of the selectin family of receptors and is involved in binding of leukocytes to the vascular endothelial wall prior to extravasation of the leukocyte, e.g. to a site of inflammation. The peptides bind pref. to E-selectin but may also bind L. or P-selectin, and can be used to treat conditions mediated by E-selectin, e.g. inflammatory conditions. The peptides have strong affinity for the selectin receptors and inhibit the binding of the sialyl Lewis (Sie-x) part of call surface glycoproteins to E-selectin. The peptide are small, generally less than 2 kb, have an ICSO of up to 100 micromole against binding of HL60 cells to ELAM-1, have one or more peptide linkages replaced by CH2OC(0)NR, chosphonate, CH2SOZNR, CM2NR, CNOK(8), or NHCONH linkages where R = H or a lower alkyl and Re = a lower alkyl. The peptides may also have a lower alkyl and C-termini e.g. succinimido, N-benzyloxycarbonyl or N-

The invention provides compounds that bind to endothelial leukocyte adhesion molecule-1 (ELAM-1). The compounds include a lead peptide adhesion molecule-1 (ELAM-1). The compounds include a lead peptide attrYMDQLWAVNW (AFFY 4", AAW26615) discovered using random peptide (c.g. "peptides on plasmids" or "peptides on plasmids" or "peptides on peptides which differ from the lead peptides on plasmids for "peptides on peptides which block the binding of HL60 cells to ELAM-1 are the peptides which block the binding of HL60 cells to ELAM-1 are the core sequence WXXLWXXM or WXXLWXX-Nle, where X is any amino acid. The peptides are used as research tools for studying the biological role of ELAM-1 and other selectin receptors; to evaluate factors that may compounds that bind to ELAM-1; and for blocking adhesion of leukocytes to compounds that bind to ELAM-1; and for blocking adhesion of leukocytes to everproduction of cytokines. The present sequence represents an example

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Claim 4; Page 80; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of srimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

 The present sequence is an isolated peptide that was tested for its ability to modulate the function of CD66 family polypeptides and CD66 ligands. 106 sequences of 13 or 14 amino acids in length, and their lands. 106 sequences of 13 or 14 amino acids in length, and their analogues, were identified that modulate the function of at least one cD66 family polypeptide and/or at least one ligand of the polypeptide. The peptides are capable of modulating activation of neutrophils, activation or inhibition, proliferation and/or differentiation of T-cells, B-cells, NK cells, LAK cells, dendritic cells, or other immune system cells, proliferation and/or differentiation of Feptidelal cells, homotypic and/or heterotypic adhesion and or definitedial cells, homotypic and/or heterotypic adhesion and cother ligands. The peptides and adhesion of CD66 family polypeptides to other ligands. The peptides are modifying the metastasis of malignant cells, for altering bacterial or viral binding to cells or a biomaterial, for altering adhesion to a biomaterial, for altering andiogenesis by contacting andothalial cells, tunnour cells or immune cells, for altering andothalial cells, tunnour cells or immune cells, for altering an immune response, and for altering keratinocyte proliferation
 Novel peptides useful for activating neutrophils or blocking activation of neutrophils, modulating homotypic or heterotypic adhesion of CD66 polypeptides, and modulating immune cell activation.
 CD66; CEACAM, adhesion molecule, antiviral, antibacterial; antiinflammatory, cytostatic; neutrophil activation; proliferation; differentiation; cancer; anglogenesis.

 The invention relates to a novel method of selecting target and target binder pairs comprising mixing in a reaction vessel phage expressing binder pairs comprising mixing in a reaction vessel phage expressing distinguishable selection markers and selecting target and target binder pairs based on the selection markers. The molecules of the invention demonstrate cytostatic activity whilst the method may be useful for selecting target and target binder pairs for preparing a composition for treating cancer. Furthermore, the method may be utilised during gene therapy procedures. The current sequence is that of the cancer-related DGI-2-binder peptide of the invention.
